

Unit 4 Discrete Random Variables

Probability Mass Functions and Expectations

A random variable is loosely speaking, a numerical quantity whose value is determined by the outcome of a probabilistic experiment e.g. the weight of a randomly selected person

Discrete: takes values in finite or countable set

Random variable examples:

Bernoulli

Uniform

Binomial

Geometric

Expected value of a random variable aka Expectation (mean)
weighted average of the values of the random variable
weighted on their probabilities

Random variables mathematically: A function from the sample space omega to the real numbers

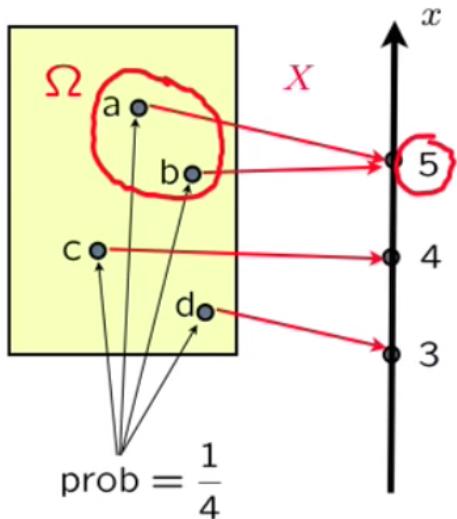

Notation: random variable X numerical value x

A function of one or more random variables is also a random variable

Probability Mass Function (PMF) aka probability law or probability distribution of X

Probability space of getting different values

$$P(5) = 1/2 \text{ a and b}$$

Notation:

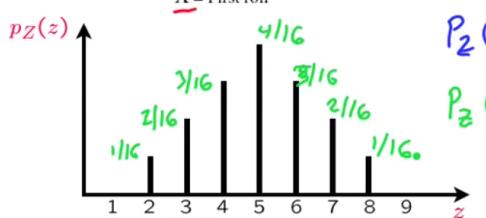

$$p_X(x) = \mathbf{P}(X = x) = \mathbf{P}(\{\omega \in \Omega \text{ s.t. } X(\omega) = x\})$$

- Properties:** $p_X(x) \geq 0$ $\sum_x p_X(x) = 1$

PMF calculation

- Two rolls of a tetrahedral die
- Let every possible outcome have probability 1/16

	4	5	6	7	8
Y = Second roll	3	4	5	6	7
	2	3	4	5	6
	1	2	3	4	5
X = First roll	1	2	3	4	

$$Z = X + Y \quad \text{Find } p_Z(z) \quad \text{for all } z$$

- repeat for all z :
 - collect all possible outcomes for which Z is equal to z
 - add their probabilities

$$P_Z(2) = P(Z=2) = 1/16$$

$$P_Z(3) = P(Z=3) = 2/16$$

$$P_Z(4) = P(Z=4) = 3/16$$

⋮

Exercise: Random variables versus numbers

1/2 points (graded)

Let X be a random variable that takes integer values, with PMF $p_X(x)$. Let Y be another integer-valued random variable and let y be a number.

a) Is $p_X(y)$ a random variable or a number?

Random variable X Answer: Number

b) Is $p_X(Y)$ a random variable or a number?

Random variable ✓ Answer: Random variable

Solution:

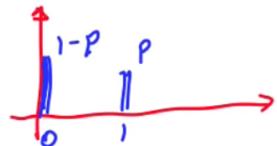

a) Recall that $p_X(\cdot)$ is a function that maps real numbers to real numbers. So, when we give it a numerical argument, y , we obtain a number.

b) In this case, we are dealing with a function, the function being $p_X(\cdot)$, of a random variable Y . And a function of a random variable is a random variable. Intuitively, the "random" value of $p_X(Y)$ is generated as follows: we observe the realized value y of the random variable Y , and then look up the numerical value $p_X(y)$.

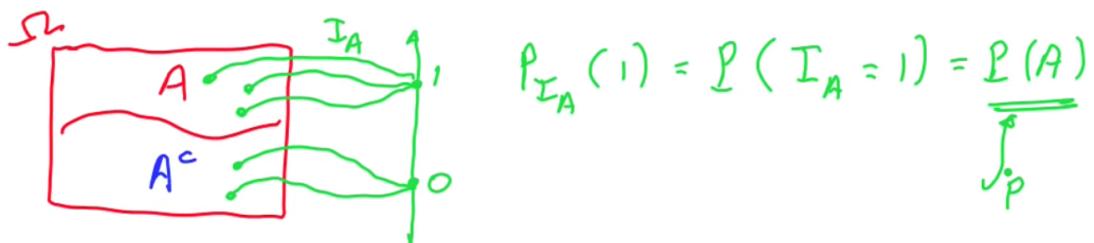

The simplest random variable: Bernoulli with parameter $p \in [0, 1]$

$$X = \begin{cases} 1, & \text{w.p. } p \\ 0, & \text{w.p. } 1 - p \end{cases}$$

$$\begin{aligned} p_X(0) &= 1 - p \\ p_X(1) &= p \end{aligned}$$

- Models a trial that results in success/failure, Heads/Tails, etc.
- Indicator r.v. of an event A : $I_A = 1$ iff A occurs

Exercise: Indicator variables

2/2 points (graded)

Let A and B be two events (subsets of the same sample space Ω), with nonempty intersection. Let I_A and I_B be the associated indicator random variables.

For each of the two cases below, select one statement that is true.

a) $I_A + I_B$:

is not the indicator random variable of any event ✓

Answer: is not the indicator random variable of any event

b) $I_A \cdot I_B$:

is the indicator variable of the event $A \cap B$ ✓

Answer: is the indicator variable of the event $A \cap B$

(*Bug warning:* In some browsers, the mathematical content in each choice in the dropdown menu may appear duplicated, e.g. $A \cup B$ may show up twice as $A \cup BA \cup B$.)

Solution:

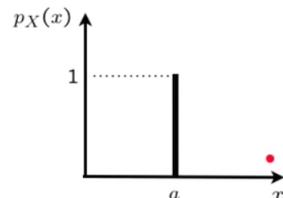

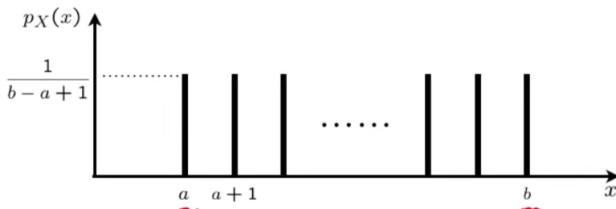

a) If the outcome of the experiment lies in the intersection of the events A and B , then $I_A + I_B$ takes the value of 2. But indicator random variables can take only the values 0 or 1. Therefore, $I_A + I_B$ is not an indicator random variable.

b) Note that $I_A \cdot I_B$ can take only the values 0 or 1. It is equal to 1 if and only if $I_A = 1$ (i.e., event A occurs) and $I_B = 1$ (i.e., event B occurs). Thus, $I_A \cdot I_B$ takes the value of 1 if and only if both A and B occur, and so it is the indicator random variable of the event $A \cap B$.

Discrete uniform random variable; parameters a, b

- **Parameters:** integers a, b ; $a \leq b$
- **Experiment:** Pick one of $a, a+1, \dots, b$ at random; all equally likely
- **Sample space:** $\{a, a+1, \dots, b\}$ $b-a+1$ possible values
- **Random variable X :** $X(\omega) = \omega$ $11:52:26 \quad \{0, 1, \dots, 59\}$
- **Model of:** complete ignorance

Special case: $a = b$
constant/deterministic r.v.

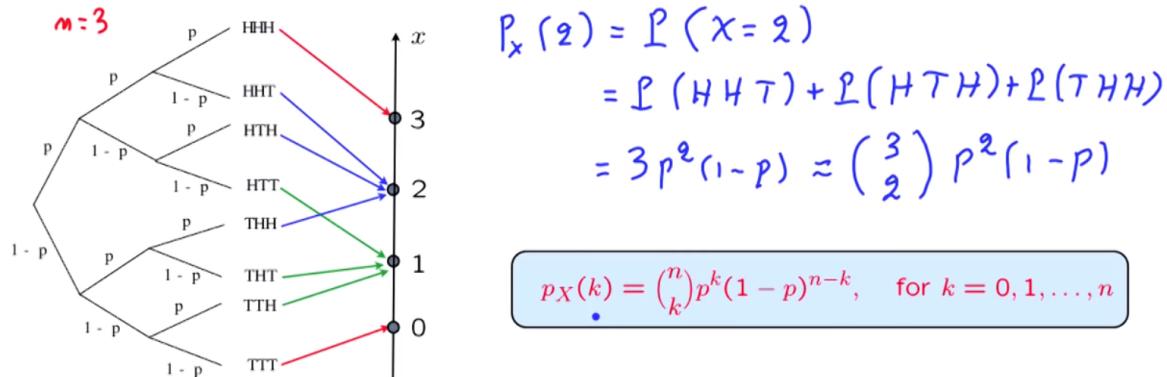

e.g. imagine looking at a clock at time 11:52:26 but only looking at the seconds
the probability of getting a number 0 to 59 is equally likely

Special case where $a = b$ is still a random variable in the mathematical sense, it

just so happens that it can only be one value in this case

Binomial random variable; **parameters:** positive integer n ; $p \in [0, 1]$

- **Experiment:** n independent tosses of a coin with $P(\text{Heads}) = p$
- **Sample space:** Set of sequences of H and T, of length n
- **Random variable X :** number of Heads observed
- **Model of:** number of successes in a given number of independent trials

Same formula as earlier but with slightly different notation

Exercise: The binomial PMF

2/2 points (graded)

You roll a fair six-sided die (all 6 of the possible results of a die roll are equally likely) 5 times, independently. Let X be the number of times that the roll results in 2 or 3. Find the numerical values of the following.

a) $p_X(2.5) =$ 0 ✓ Answer: 0

b) $p_X(1) =$ 0.3292 ✓ Answer: 0.32922

Solution:

a) A value of 2.5 is not possible for X since the number of rolls must be an integer, and therefore $p_X(2.5) = 0$.

b) For each die roll, there is a probability $2/6 = 1/3$ of obtaining a 2 or a 3. Hence, the random variable X is binomial with parameters $n = 5$ and $p = 1/3$, so that $p_X(1) = \binom{5}{1} \cdot (1/3) \cdot (2/3)^4 \approx 0.32922$.

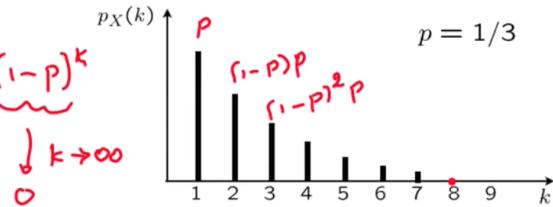

Geometric random variable; parameter p : $0 < p \leq 1$

- **Experiment:** infinitely many independent tosses of a coin; $P(\text{Heads}) = p$
- **Sample space:** Set of infinite sequences of H and T $\overbrace{\text{TTTTHHT...}}^X=5$
- **Random variable X :** number of tosses until the first Heads

- **Model of:** waiting times; number of trials until a success

$$p_X(k) = P(X=k) = P(\underbrace{\text{T...T}}_{k-1} \text{H}) = (1-p)^{k-1} p \quad k=1, 2, 3, \dots$$

$$\begin{aligned} P(\text{no Heads ever}) &\leq P(\underbrace{\text{T...T}}_k) = (1-p)^k \\ (\underbrace{\text{TTT...}}_{\text{"X}=\infty\text{"}}) &= 0 \end{aligned}$$

$P(\text{Tails forever})$ becomes 0 as k goes to infinity

Exercise: Geometric random variables

0/2 points (graded)

Let X be a geometric random variable with parameter p . Find the probability that $X \geq 10$. Express your answer in terms of p using standard notation (click on the "STANDARD NOTATION" button below.)

$$P(X \geq 10) = \boxed{p/(1-(1-p)^9)}$$

✖ Answer: $(1-p)^9$

$$\frac{p}{1 - ((1 - p)^9)}$$

STANDARD NOTATION

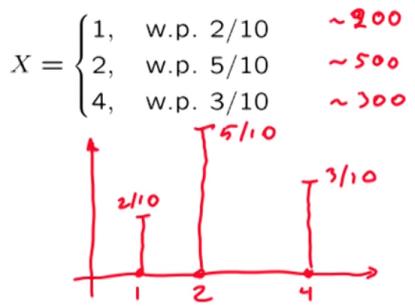

Solution:

We can calculate the desired probability by adding the probabilities of the events $\{X = 10\}$, $\{X = 11\}$, $\{X = 12\}$, etc., and using the formula for the sum of a geometric series. However, we can get the answer in an easier way, using the interpretation of geometric random variables as the number of trials until the first success. The event $\{X \geq 10\}$ is the event that the first 9 trials resulted in failure, and therefore its probability is $(1 - p)^9$.

Expectation/mean of a random variable

- **Motivation:** Play a game 1000 times.
Random gain at each play described by:
• “Average” gain:

$$\begin{aligned} & \frac{1 \cdot 200 + 2 \cdot 500 + 4 \cdot 300}{1000} \\ &= 1 \cdot \frac{2}{10} + 2 \cdot \frac{5}{10} + 4 \cdot \frac{3}{10} \end{aligned}$$

- **Definition:** $E[X] = \sum_x x p_X(x)$

- **Interpretation:** Average in large number of independent repetitions of the experiment

- **Caution:** If we have an infinite sum, it needs to be well-defined.
We assume $\sum_x |x| p_X(x) < \infty$

Expectation of a Bernoulli r.v.

Video position. Press space to toggle playback

$$X = \begin{cases} 1, & \text{w.p. } p \\ 0, & \text{w.p. } 1 - p \end{cases} \quad E[X] = 1 \cdot p + 0 \cdot (1 - p) = p$$

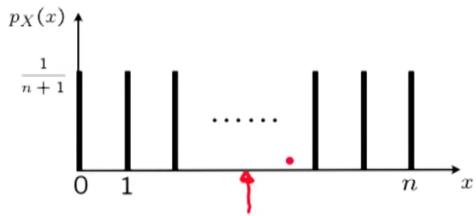

If X is the indicator of an event A , $X = I_A$:

$$X = 1 \text{ iff } A \text{ occurs} \quad p = P(A)$$

$$E[I_A] = P(A)$$

Expectation of a uniform r.v.

- Uniform on $0, 1, \dots, n$

• Definition: $E[X] = \sum_x x p_X(x)$

$$\begin{aligned} E[X] &= 0 \cdot \frac{1}{n+1} + 1 \cdot \frac{1}{n+1} + \dots + n \cdot \frac{1}{n+1} \\ &= \frac{1}{n+1} (0 + 1 + \dots + n) = \frac{1}{n+1} \cdot \frac{n(n+1)}{2} = \frac{n}{2} \end{aligned}$$

Elementary properties of expectations

- If $X \geq 0$, then $E[X] \geq 0$
for all ω : $X(\omega) \geq 0$

• Definition: $E[X] = \sum_x x p_X(x)$

≥ 0 ≥ 0 ≥ 0

- If $a \leq X \leq b$, then $a \leq E[X] \leq b$

for all ω : $a \leq X(\omega) \leq b$

$$\begin{aligned} E[X] &= \sum_x x p_X(x) \geq \sum_x a p_X(x) \\ &= a \sum_x p_X(x) = a \cdot 1 = a \end{aligned}$$

- If c is a constant, $E[c] = c$

$\xrightarrow{\quad c \quad}$

$$E[c] = c \cdot p(c) = c$$

Exercise: Random variables with bounded range

3/3 points (graded)

Suppose a random variable X can take any value in the interval $[-1, 2]$ and a random variable Y can take any value in the interval $[-2, 3]$.

a) The random variable $X - Y$ can take any value in an interval $[a, b]$. Find the values of a and b :

$$a = \boxed{-4} \quad \checkmark$$

$$b = \boxed{4} \quad \checkmark$$

b) Can the expected value of $X + Y$ be equal to 6?

$$\text{No} \quad \checkmark$$

The expected value rule, for calculating $E[g(X)]$

- Let X be a r.v. and let $Y = g(X)$
- Averaging over y : $E[Y] = \sum_y y p_Y(y)$
 $3 \cdot (0.1+0.2) + 4 \cdot (0.3+0.4)$
- Averaging over x : $3 \cdot 0.1 + 3 \cdot 0.2 + 4 \cdot 0.3 + 4 \cdot 0.5$

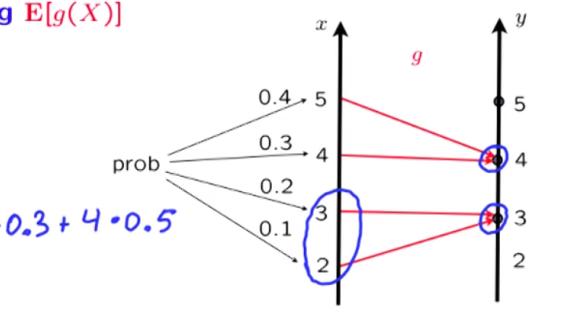

$$E[Y] = E[g(X)] = \sum_x g(x) p_X(x)$$

Proof:

$$\sum_y \sum_{x: g(x)=y} g(x) p_x(x)$$

$$= \sum_y \sum_{x: g(x)=y} p_x(x) = \sum_y \sum_{x: g(x)=y} p_x(x)$$

$$= \sum_y y p_Y(y) = E[Y]$$

- $E[X^2] = \sum_x x^2 p_x(x)$
- Caution: In general, $E[g(X)] \neq g(E[X])$

$$E[X^2] \neq (E[X])^2$$

Linearity of expectation: $E[aX + b] = aE[X] + b$

$X = \text{Salary}$ $E[X] = \text{average salary}$

$Y = \text{new salary} = 2X + 100$ $E[Y] = E[2X + 100] = 2E[X] + 100$

- Intuitive

- **Derivation**, based on the expected value rule:

$$E[Y] = \sum_x g(x) p_x(x)$$

$$= \sum_x (ax + b) p_x(x) = a \sum_x x p_x(x) + b \sum_x p_x(x)$$

$$E[g(x)] = g(E[x]) = aE[x] + b$$

exceptional g

$$g(x) = ax + b$$

$$Y = g(x)$$

The blue equality is only true for linear functions

Exercise: Linearity of expectations

3/3 points (graded)

The random variable X is known to satisfy $E[X] = 2$ and $E[X^2] = 7$. Find the expected value of $8 - X$ and of $(X - 3)(X + 3)$.

a) $E[8 - X] =$ ✓

b) $E[(X - 3)(X + 3)] =$ ✓

Variance; Conditioning on an event; Multiple random variables

Variance - quantifies the spread of a probability mass function (PMF)

We look at the distance from the mean

If we look at the average distance from the mean it is always = 0 so it is not informative

However if we look at the average of the distance^2 it is informative

- **Definition of variance:** $\text{var}(X) = E[(X - \mu)^2]$

Variance is always positive

Standard deviation: $\sigma_X = \sqrt{\text{var}(X)}$

Variance is not in the same units as the original random variable but the square root of it is (standard deviation)

Properties of the variance

- Notation: $\mu = E[X]$

$$\text{var}(aX + b) = a^2 \text{var}(X)$$

$$\begin{aligned} \text{var}(3-4x) \\ = (-4)^2 \text{var}(x) \\ = 16 \text{var}(x) \end{aligned}$$

- Let $Y = X + b$ $\mu = E[Y] = \mu + b$
 $\text{var}(Y) = E[(Y - \mu)^2] = E[(X + b - (\mu + b))^2] = E[(X - \mu)^2] = \text{var}(X)$
- Let $Y = aX$ $\mu = E[Y] = a\mu$
 $\text{var}(Y) = E[(aX - a\mu)^2] = E[a^2(X - \mu)^2] = a^2 E[(X - \mu)^2] = a^2 \text{var}(X)$

A useful formula: $\text{var}(X) = E[X^2] - (E[X])^2$

$$\begin{aligned} \text{var}(x) &= E[(x - \mu)^2] = E[x^2 - 2\mu x + \mu^2] \\ &= E[x^2] - 2\mu E[x] + \mu^2 = E[x^2] - (E[x])^2 \end{aligned}$$

First calculation in red shows that adding a constant to a random variable does not change its variance (the b's cancel out)

Second calculation in red shows that multiplying a random variable by a constant would be multiplying the variance by a^2

Useful formula is a quick and easy way to calculate variance

Note: The derivation of the useful alternative formula for the variance, near the end of the video, uses a linearity property for multiple random variables (in this case, the variables X and X^2), which we have not yet discussed.

A derivation that does not rely on this linearity property, goes as follows: This expression is verified as follows:

$$\begin{aligned}
 \text{var}(X) &= \sum_x (x - \mathbf{E}[X])^2 p_X(x) \\
 &= \sum_x (x^2 - 2x\mathbf{E}[X] + (\mathbf{E}[X])^2) p_X(x) \\
 &= \sum_x x^2 p_X(x) - 2\mathbf{E}[X] \sum_x x p_X(x) + (\mathbf{E}[X])^2 \sum_x p_X(x) \\
 &= \mathbf{E}[X^2] - 2(\mathbf{E}[X])^2 + (\mathbf{E}[X])^2 \\
 &= \mathbf{E}[X^2] - (\mathbf{E}[X])^2.
 \end{aligned}$$

(The sum of all x's multiplied by their probability is the expected value of x)

Exercise: Variance properties

0/1 point (graded)

Is it always true that $\mathbf{E}[X^2] \geq (\mathbf{E}[X])^2$?

No

✖ Answer: Yes

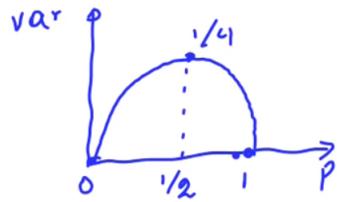

Solution:

We know that variances are always nonnegative and that $\text{Var}(X) = \mathbf{E}[X^2] - (\mathbf{E}[X])^2$. Therefore, $0 \leq \text{Var}(X) = \mathbf{E}[X^2] - (\mathbf{E}[X])^2$, or, equivalently, $\mathbf{E}[X^2] \geq (\mathbf{E}[X])^2$.

Variance of the Bernoulli

$$X = \begin{cases} 1, & \text{w.p. } p \\ 0, & \text{w.p. } 1-p \end{cases}$$

$$E[X] = p$$

$$\begin{aligned} \text{var}(X) &= \sum_x (x - E[X])^2 p_X(x) = (1-p)^2 p + (0-p)^2 \cdot (1-p) \\ &= p - 2p^2 + p^2 + p^2 - p^3 = p - p^2 = p(1-p) \end{aligned}$$

$$\text{var}(X) = E[X^2] - (E[X])^2 = E[X] - (E[X])^2 = p - p^2 = \boxed{p(1-p)}$$

$X^2 = X$

$X^2 = X$ here only because it is a Bernoulli random variable i.e. is a 0 or 1

Both methods show what the variance is

Plotting variance as a function of p we see that variance peaks when p is 0.5 i.e. when a coin toss is fair it is the most random

Variance of the uniform

$$\frac{1}{6} n(n+1)(2n+1)$$

$$\begin{aligned} \text{var}(x) &= E[X^2] - (E[X])^2 = \frac{1}{n+1} (0^2 + 1^2 + 2^2 + \dots + n^2) - \left(\frac{n}{2}\right)^2 \\ &= \frac{1}{12} n(n+2) \end{aligned}$$

$$\text{Var}(x) = \frac{1}{12} (b-a)(b-a+2)$$

second is a more general form where it doesn't start from 0 necessarily
This shift is equivalent to adding a constant to the r.v. therefore the variance does not change

We just have to substitute $b-a$ in for n

Exercise: Variance of the uniform

2/2 points (graded)

Suppose that the random variable X takes values in the set $\{0, 2, 4, 6, \dots, 2n\}$ (the even integers between 0 and $2n$, inclusive), with each value having the same probability. What is the variance of X ?
Hint: Consider the random variable $Y = X/2$ and recall that the variance of a uniform random variable on the set $\{0, 1, \dots, n\}$ is equal to $n(n+2)/12$.

Express your answer in terms of n using standard notation. Remember to write '*' for all multiplications and to include parentheses where necessary.

$$\text{Var}(X) = \frac{n^*(n+2))/3}{3}$$

Conditioning

Creating a new PMF based on information that an event has happened such as A

This is just another PMF and follows the same rules as ordinary PMFs except probabilities are replaced by conditional probabilities

Conditional PMF and expectation, given an event

- Condition on an event $A \Rightarrow$ use conditional probabilities

$$p_X(x) = P(X = x)$$

$$p_{X|A}(x) = \underline{P(X = x | A)}$$

assume
 $P(A) > 0$

$$\sum_x p_X(x) = 1$$

$$\sum_x p_{X|A}(x) = 1$$

$$E[X] = \sum_x x p_X(x)$$

$$E[X | A] = \sum_x x p_{X|A}(x)$$

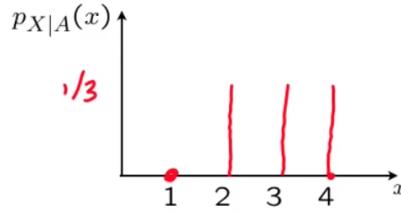

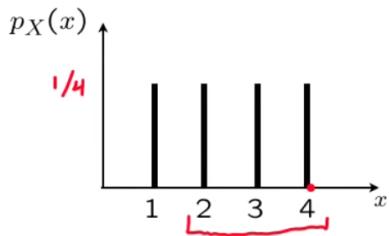

$$E[g(X)] = \sum_x g(x) p_X(x)$$

$$E[g(X) | A] = \sum_x g(x) p_{X|A}(x)$$

*

Example of conditioning

- Let $A = \{X \geq 2\}$

$$E[X] = 2.5$$

$$E[X | A] = 3$$

$$\begin{aligned} \text{var}(X) &= \frac{1}{12}(b-a)(b-a+2) \\ &= \frac{1}{12} 3 \cdot 5 = \frac{5}{4} \end{aligned}$$

$$\begin{aligned} \text{var}(X | A) &= \frac{1}{3} (4-3)^2 + \frac{1}{3} (3-3)^2 \\ &\quad + \frac{1}{3} (2-3)^2 = \frac{2}{3} \end{aligned}$$

In the last example, we saw that the conditional distribution of X , which was a uniform over a smaller range (and in some sense, less uncertain), had a smaller variance, i.e., $\text{Var}(X | A) \leq \text{Var}(X)$. Here is an example where this is not true. Let Y be uniform on $\{0, 1, 2\}$ and let B be the event that Y belongs to $\{0, 2\}$.

a) What is the variance of Y ?

$$\text{Var}(Y) = \boxed{8/12} \quad \checkmark$$

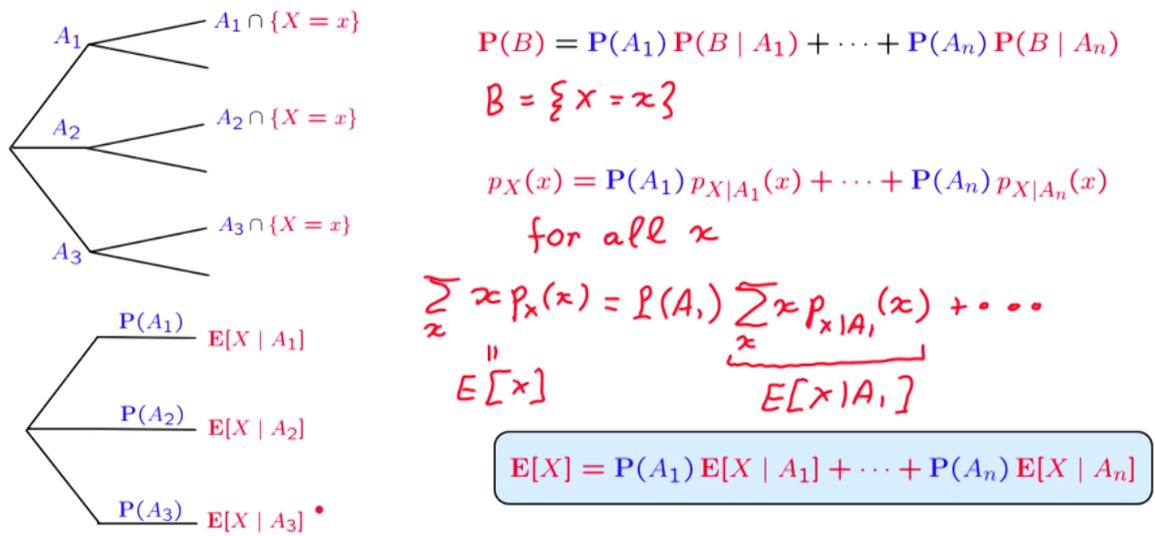

b) What is the conditional variance $\text{Var}(Y | B)$?

$$\text{Var}(Y | B) = \boxed{1} \quad \checkmark$$

Conditional probabilities allow us to divide and conquer

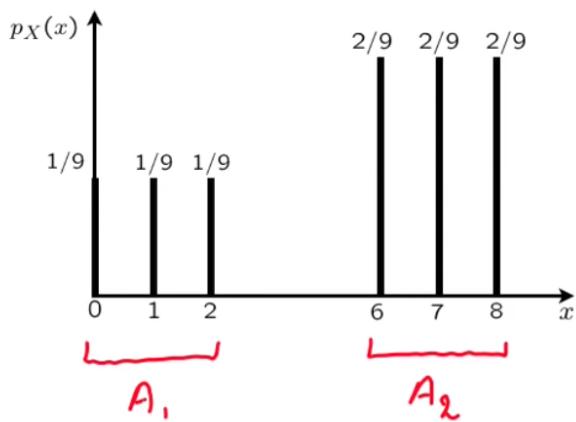

Reminder of Total Probability Theorem
translated to total expectation theorem

Total expectation theorem

Each event is weighted by its probability

Total expectation example

$$P(A_1) = \frac{1}{3}$$

$$P(A_2) = \frac{2}{3}$$

$$E[X | A_1] = 1$$

$$E[X | A_2] = 7$$

$$E[X] = \frac{1}{3} \cdot 1 + \frac{2}{3} \cdot 7$$

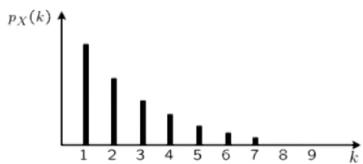

Geometric PMG, memorylessness and expectation

memorylessness: coin tosses have no 'memory', one coin toss isn't affected by the last

Conditioning a geometric random variable

- X : number of independent coin tosses until first head; $P(H) = p$

$$p_X(k) = (1-p)^{k-1}p, \quad k = 1, 2, \dots$$

Memorylessness:

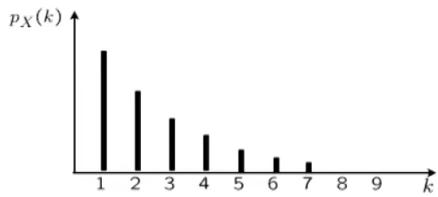

Number of **remaining** coin tosses, conditioned on Tails in the first toss, is **Geometric**, with parameter p

Conditioned on $X > n$, $X - n$ is geometric with parameter p

$$\begin{aligned} p_{x-1|x>1}(3) &= P(X-1=3 | X>1) = P(T_2 T_3 H_4 | T_1) = P(T_2 T_3 H_4) \\ p_{x-1|x>1}(k) &= p_x(k) = p_{x-n|x>n}(k) = (1-p)^{k-n} p = p_x(3) \end{aligned}$$

$X > n$ is saying that the first n tosses were tails

The mean of the geometric

$$E[X] = \sum_{k=1}^{\infty} kp_X(k) = \sum_{k=1}^{\infty} k(1-p)^{k-1}p$$

$$E[X] = \frac{1}{p}$$

$$\begin{aligned} E[X] &= 1 + E[X-1] \\ &= 1 + p \cdot E[X-1 | X=1] + (1-p) E[X-1 | X>1] \\ &= 1 + 0 + (1-p) E[X] \end{aligned}$$

Exercise: Total expectation calculation

2/2 points (graded)

We have two coins, A and B. For each toss of coin A, we obtain Heads with probability $1/2$; for each toss of coin B, we obtain Heads with probability $1/3$. All tosses of the same coin are independent. We select a coin at random, where the probability of selecting coin A is $1/4$, and then toss it until Heads is obtained for the first time.

The expected number of tosses until the first Heads is:

2.75

For A $E[h] = 1 / (1/2) \times P(\text{selecting A}) = 1/4 = 0.5$

For B $E[h] = 1 / (1/3) \times P(\text{selecting B}) = 3/4 = 2.25$

$$0.5 + 2.25 = 2.75$$

Exercise: Memorylessness of the geometric

2/2 points (graded)

Let X be a geometric random variable, and assume that $\text{Var}(X) = 5$.

a) What is the conditional variance $\text{Var}(X - 4 | X > 4)$?

$$\text{Var}(X - 4 | X > 4) = \boxed{5} \quad \checkmark \text{ Answer: 5}$$

b) What is the conditional variance $\text{Var}(X - 8 | X > 4)$?

$$\text{Var}(X - 8 | X > 4) = \boxed{5} \quad \checkmark \text{ Answer: 5}$$

Solution:

a) The conditional distribution of $X - 4$ given $X > 4$ is the same geometric PMF that describes the distribution of X . Hence $\text{Var}(X - 4 | X > 4) = \text{Var}(X) = 5$.

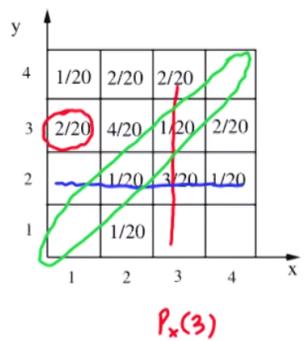

b) In the conditional model (i.e., given that $X > 4$), the random variables $X - 4$ and $X - 8$ differ by a constant. Hence they have the same variance and the answer is again 5.

Join PMFs and the expected value rule

Multiple random variables and joint PMFs

$$X : p_X \quad Y : p_Y \quad \text{marginal pmfs}$$
$$P(X = Y) = \frac{9}{20}$$

$$\text{Joint PMF: } p_{X,Y}(x,y) = P(X = x \text{ and } Y = y)$$

$$P_{X,Y}(1,3) = \frac{2}{20}$$

$$P_X(4) = \frac{1}{20} + \frac{2}{20}$$

$$P_Y(2) = \frac{1}{20} + \frac{3}{20} + \frac{1}{20}$$

$$\sum_x \sum_y p_{X,Y}(x,y) = 1$$

$$p_X(x) = \sum_y p_{X,Y}(x,y)$$

$$p_Y(y) = \sum_x p_{X,Y}(x,y)$$

Once we have a join PMF we can answer questions about the marginal PMFs (single)

More than two random variables

$$p_{X,Y,Z}(x,y,z) = \mathbf{P}(X = x \text{ and } Y = y \text{ and } Z = z)$$

$$\sum_x \sum_y \sum_z p_{X,Y,Z}(x,y,z) = 1$$

$$p_X(x) = \sum_y \sum_z p_{X,Y,Z}(x, \underline{y}, \underline{z})$$

$$p_{X,Y}(x,y) = \sum_z p_{X,Y,Z}(x, \underline{y}, \underline{z})$$

Functions of multiple random variables

$$Z = g(X, Y)$$

$$\text{PMF: } p_Z(z) = \mathbf{P}(Z = z) = \mathbf{P}(g(X, Y) = z) = \sum_{(x,y) : g(x,y) = z} p_{X,Y}(x,y)$$

$$\text{Expected value rule: } E[g(X, Y)] = \sum_x \sum_y g(x,y) p_{X,Y}(x,y)$$

$$E[g(x)]$$

Summing over x,y pairs to give an expected value of a random variable given by the function $g(x,y)$

Exercise: Joint PMF calculation

2/2 points (graded)

The random variable V takes values in the set $\{0, 1\}$ and the random variable W takes values in the set $\{0, 1, 2\}$. Their joint PMF is of the form

$$p_{V,W}(v, w) = c \cdot (v + w),$$

where c is some constant, for v and w in their respective ranges, and is zero everywhere else.

a) Find the value of c .

$$c = \boxed{0.11111}$$

✓ Answer: 0.11111

b) Find $p_V(1)$.

$$p_V(1) = \boxed{2/3}$$

✓ Answer: 0.66667

Solution:

a) The sum of the entries of the PMF is $c \cdot (0 + 0) + c \cdot (0 + 1) + c \cdot (0 + 2) + c \cdot (1 + 0) + \dots = 9c$. Since this sum must be equal to 1, we have $c = 1/9$.

b)

$$p_V(1) = \sum_{w=0}^2 p_{V,W}(1, w) = p_{V,W}(1, 0) + p_{V,W}(1, 1) + p_{V,W}(1, 2) = \frac{1}{9}(1 + 2 + 3) = \frac{6}{9}.$$

Let X and Y be discrete random variables. For each one of the formulas below, state whether it is true or false.

a) $\mathbf{E}[X^2] = \sum_x x p_X(x^2)$

✓ Answer: False

b) $\mathbf{E}[X^2] = \sum_x x^2 p_X(x)$

✓ Answer: True

c) $\mathbf{E}[X^2] = \sum_x x^2 p_{X,Y}(x)$

✗ Answer: False

d) $\mathbf{E}[X^2] = \sum_x x^2 p_{X,Y}(x, y)$

✓ Answer: False

e) $\mathbf{E}[X^2] = \sum_x \sum_y x^2 p_{X,Y}(x, y)$

✗ Answer: True

f) $\mathbf{E}[X^2] = \sum_z z p_{X^2}(z)$

✓ Answer: True

a) False. This does not follow from any of our formulas.

b) True. This is the expected value rule for a function of a single random variable.

c) False. This is syntactically wrong since the function $p_{X,Y}$ needs two arguments.

d) False. The left-hand side is a number whereas the right-hand side is actually a function of y .

e) True. This is the expected value rule

$$\mathbf{E}[g(X, Y)] = \sum_x \sum_y g(x, y) p_{X,Y}(x, y),$$

for the function $g(x, y) = x^2$.

f) True. This is just the definition of the expectation $\mathbf{E}[Z] = \sum_z z p_Z(z)$, where Z is the random variable X^2 .

Linearity of expectations and the mean of the binomial

Derivation of linearity of expectations

Linearity of expectations

$$E[aX + b] = aE[X] + b$$

$$E[X + Y] = E[X] + E[Y]$$

$$= \sum_x \sum_y (x+y) p_{x,y}(x,y)$$

$$= \underbrace{\sum_x x \sum_y p_{x,y}(x,y)} + \underbrace{\dots}$$

$$= \sum_x x p_x(x) + \sum_y y p_y(y) = E[X] + E[Y]$$

And for multiple variables

$$E[X_1 + \dots + X_n] = E[X_1] + \dots + E[X_n]$$

The mean of the binomial

- X : binomial with parameters n, p
 - number of successes in n independent trials

$X_i = 1$ if i th trial is a success; $\frac{p}{\text{---}}$
 $X_i = 0$ otherwise $\frac{1-p}{\text{---}}$

$$E[X] = \sum_{k=0}^n k \underbrace{\binom{n}{k} p^k (1-p)^{n-k}}_{P_X(k)}$$

$$E[X] = np$$

$$X = X_1 + \dots + X_n$$

$$E[X] = \underbrace{E[X_1]}_p + \dots + \underbrace{E[X_n]}_p = np$$

Exercise: Linearity of expectations drill

1/1 point (graded)

Suppose that $\mathbf{E}[X_i] = i$ for every i . Then,

$$\mathbf{E}[X_1 + 2X_2 - 3X_3] =$$

-4

Exercise: Using linearity of expectations

2/2 points (graded)

We have two coins, A and B. For each toss of coin A, we obtain Heads with probability $1/2$; for each toss of coin B, we obtain Heads with probability $1/3$. All tosses of the same coin are independent.

We toss coin A until Heads is obtained for the first time. We then toss coin B until Heads is obtained for the first time with coin B.

The expected value of the total number of tosses is:

5

✓ Answer: 5

Solution:

Let T_A and T_B be the number of tosses of coins A and B , respectively. We know that T_A is geometric with parameter $p = 1/2$, so that $\mathbf{E}[T_A] = 1/p = 1/(1/2) = 2$. Similarly, $\mathbf{E}[T_B] = 3$. The total number of coin tosses is $T_A + T_B$. Using linearity,

$$\mathbf{E}[T_A + T_B] = \mathbf{E}[T_A] + \mathbf{E}[T_B] = 2 + 3 = 5.$$

Conditioning on a random variable; Independence of random variables

Conditional PMFs

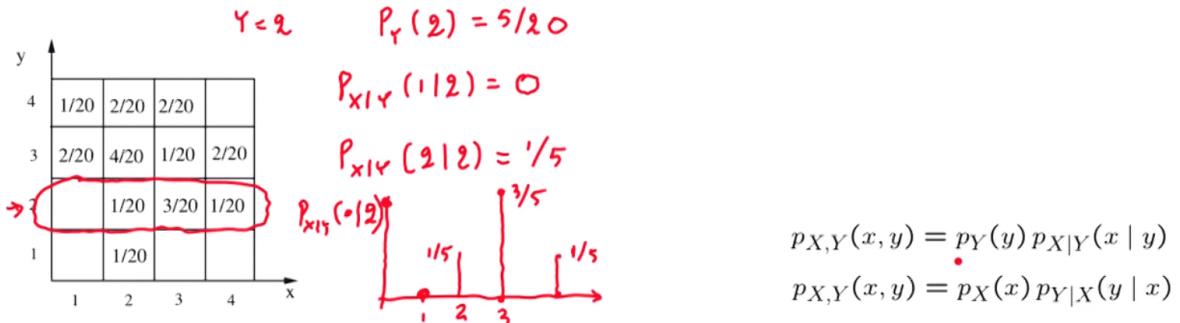

$$A = \{Y = y\}$$

$$p_{X|A}(x | A) = P(X = x | A) \quad p_{X|Y}(x | y) = P(X = x | Y = y) = \frac{P(X = x, Y = y)}{P(Y = y)}$$

$$p_{X|Y}(x | y) = \frac{p_{X,Y}(x, y)}{p_Y(y)}$$

defined for y such that $p_Y(y) > 0$

$$\sum_x p_{X|Y}(x | y) = 1$$

Like scaling the original probabilities to a new 'world' i.e. 5 as the denominator

Conditional PMFs involving more than two r.v.'s

- Self-explanatory notation

$$p_{X|Y,Z}(x | y, z) = P(X = x | Y = y, Z = z) = \frac{P(X = x, Y = y, Z = z)}{P(Y = y, Z = z)} = \frac{p_{x,y,z}(x, y, z)}{p_{y,z}(y, z)}$$

$$p_{X,Y|Z}(x, y | z) = P(X = x, Y = y | Z = z)$$

- Multiplication rule

$$P(A \cap B \cap C) = P(A) P(B | A) P(C | A \cap B)$$

$$A = \{X = x\} \quad B = \{Y = y\} \quad C = \{Z = z\}$$

$$p_{X,Y,Z}(x, y, z) = p_X(x) p_{Y|X}(y | x) p_{Z|X,Y}(z | x, y)$$

Multiplication rule at the bottom is the $P(X=x)$ happening $\times P(Y=y | X=x) \times P(Z=z | X=x \text{ and } Y=y)$

Note: The notation $p_{X|A}(x | A)$ should be $p_{X|A}(x)$.

For each of the formulas below, state whether it is true or false.

a) $p_{X,Y,Z}(x, y, z) = p_Y(y) p_{Z|Y}(z | y) p_{X|Y,Z}(x | y, z)$

True ▼ ✓ Answer: True

b) $p_{X,Y|Z}(x, y | z) = p_X(x) p_{Y|Z}(y | z)$

False ▼ ✓ Answer: False

c) $p_{X,Y|Z}(x, y | z) = p_{X|Z}(x | z) p_{Y|X,Z}(y | x, z)$

True ▼ ✓ Answer: True

d) $\sum_x p_{X,Y|Z}(x, y | z) = 1$

False ▼ ✓ Answer: False

e) $\sum_x \sum_y p_{X,Y|Z}(x, y | z) = 1$

True ▼ ✓ Answer: True

f) $p_{X,Y|Z}(x, y | z) = \frac{p_{X,Y,Z}(x, y, z)}{p_Z(z)}$

True ▼ ✓ Answer: True

g) $p_{X|Y,Z}(x | y, z) = \frac{p_{X,Y,Z}(x, y, z)}{p_{Y,Z}(y, z)}$

True ▼ ✓ Answer: True

Conditional expectation

$$A = \{Y = y\}$$

$$\mathbf{E}[X] = \sum_x x p_X(x) \quad \mathbf{E}[X | A] = \sum_x x p_{X|A}(x) \quad \mathbf{E}[X | Y = y] = \sum_x x p_{X|Y}(x | y)$$

- Expected value rule

$$\mathbf{E}[g(X)] = \sum_x g(x) p_X(x) \quad \mathbf{E}[g(X) | A] = \sum_x g(x) p_{X|A}(x)$$

$$\mathbf{E}[g(X) | Y = y] = \sum_x g(x) p_{X|Y}(x | y)$$

•

Total probability and expectation theorems

$$\bullet \quad A_1, \dots, A_n: \text{partition of } \Omega \quad Y = \{y_1, \dots, y_n\} \quad A_i = \{Y = y_i\}$$

$$\bullet \quad p_X(x) = \mathbf{P}(A_1) p_{X|A_1}(x) + \dots + \mathbf{P}(A_n) p_{X|A_n}(x)$$

$$p_X(x) = \sum_y p_Y(y) p_{X|Y}(x | y)$$

$$\bullet \quad \mathbf{E}[X] = \mathbf{P}(A_1) \mathbf{E}[X | A_1] + \dots + \mathbf{P}(A_n) \mathbf{E}[X | A_n]$$

$$\boxed{\mathbf{E}[X] = \sum_y p_Y(y) \mathbf{E}[X | Y = y]} \quad \bullet$$

- Fine print:

Also valid when Y is a discrete r.v. that ranges over an infinite set,
as long as $\mathbf{E}[|X|] < \infty$

For each of the formulas below, state whether it is true or false.

$$1) \mathbf{E}[g(X, Y) | Y = 2] = \sum_x g(x, y) p_{X,Y}(x, y)$$

False

✓ Answer: False

$$2) \mathbf{E}[g(X, Y) | Y = 2] = \sum_x g(x, y) p_{X,Y}(x, 2)$$

False

✓ Answer: False

$$3) \mathbf{E}[g(X, Y) | Y = 2] = \sum_x g(x, 2) p_{X,Y}(x, 2)$$

False

✓ Answer: False

$$4) \mathbf{E}[g(X, Y) | Y = 2] = \sum_x g(x, 2) p_{X|Y}(x | 2)$$

True

✓ Answer: True

$$5) \mathbf{E}[g(X, Y) | Y = 2] = \sum_x g(x, 2) \frac{p_{X,Y}(x, 2)}{p_Y(2)}$$

False

✗ Answer: True

$$6) \mathbf{E}[g(X, Y) | Y = 2] = \sum_x \sum_y g(x, y) p_{X,Y|Y}(x, y | 2)$$

False

✗ Answer: True

1-3) There is no reason for any of the first three formulas to be true.

4) True. This is just the usual expected value rule, in a model in which the event $\{Y = 2\}$ is known to have occurred. Given the information that $Y = 2$, the function $g(x, y)$ is replaced by $g(x, 2)$, and we are dealing with a function $g(x, 2)$ of a single variable x . We apply the expected value rule for a function of a single variable, but since we are within a conditional model, we need to use the conditional PMF of X .

5) True. This is the same as the fourth statement, except that we have substituted in the definition of $p_{X|Y}(x | 2)$.

6) True. This is just the expected value rule for a function of two variables, applied within a conditional universe where the event $\{Y = 2\}$ is known to have occurred.

Notice that $p_{X,Y|Y}(x, y | 2)$ will be zero for any $y \neq 2$. And for $y = 2$,

$$p_{X,Y|Y}(x, 2 | 2) = \mathbf{P}(X = x, Y = 2 | Y = 2) = \mathbf{P}(X = x | Y = 2) = p_{X|Y}(x | 2),$$

so that the sixth formula agrees with the fourth one.

Independence of random variables

Independence

- of two events: $\mathbf{P}(A \cap B) = \mathbf{P}(A) \cdot \mathbf{P}(B)$ $\mathbf{P}(A | B) = \mathbf{P}(A)$
- of a r.v. and an event: $\mathbf{P}(\underline{X = x} \text{ and } \underline{A}) = \mathbf{P}(X = x) \cdot \mathbf{P}(A)$, for all x
 $p_{x|A}(x) = p_x(x)$, for all x $\mathbf{P}(A | X = x) = \mathbf{P}(A)$, for all x
- of two r.v.'s: $\mathbf{P}(\underline{X = x} \text{ and } \underline{Y = y}) = \mathbf{P}(X = x) \cdot \mathbf{P}(Y = y)$, for all x, y
 $p_{x|y}(x|y) = p_x(x)$ $p_{X,Y}(x, y) = p_X(x)p_Y(y)$, for all x, y
 $p_{y|x}(y|x) = p_y(y)$

X, Y, Z are independent if:

$$p_{X,Y,Z}(x, y, z) = p_X(x)p_Y(y)p_Z(z), \text{ for all } x, y, z$$

The occurrence of one event happening does not affect our beliefs(probabilities) of other events happening

Exercise: Independence

3/5 points (graded)

Let X , Y , and Z be discrete random variables.

a) Suppose that Z is identically equal to 3, i.e., $\mathbf{P}(Z = 3) = 1$. Is X guaranteed to be independent of Z ?

No

Answer: Yes

b) Would either of the following be an appropriate definition of independence of the pair (X, Y) from Z ?

- $p_{X,Y,Z}(x, y, z) = p_X(x) p_Y(y) p_Z(z)$, for all x, y, z

No

Answer: No

- $p_{X,Y,Z}(x, y, z) = p_{X,Y}(x, y) p_Z(z)$, for all x, y, z

Yes

Answer: Yes

c) Suppose that X, Y, Z are independent. Is it true that X and Y are independent?

Yes

Answer: Yes

d) Suppose that X, Y, Z are independent. Is it true that (X, Y) is independent from Z ?

No

Answer: Yes

a) Since Z is deterministic, the value of Z does not provide any information, and so, intuitively, we have independence. For a formal argument, suppose that $z \neq 3$. Then, $p_{X,Z}(x, z) = 0 = p_X(x) p_Z(z)$. And for $z = 3$, $p_{X,Z}(x, 3) = \mathbf{P}(X = x, Z = 3) = \mathbf{P}(X = x) = \mathbf{P}(X = x) \cdot 1 = p_X(x) p_Z(3)$, so that the definition of independence is satisfied.

b) The second definition is correct, because it says that events of the form $\{X = x \text{ and } Y = y\}$ are independent from events of the form $\{Z = z\}$. On the other hand, the first imposes the stronger requirement that X is also independent of Y .

c) Intuitively, since X, Y, Z are independent, none of the random variables provides information about the others. For a formal argument,

$$p_{X,Y}(x, y) = \sum_z p_{X,Y,Z}(x, y, z) = \sum_z p_X(x) p_Y(y) p_Z(z) = p_X(x) p_Y(y) \sum_z p_Z(z) = p_X(x) p_Y(y).$$

d) Intuitively, the value of the pair (X, Y) provides no information about the random variable Z . We will verify that the appropriate definition of independence of (X, Y) from Z from part (b) is satisfied. We first use independence of X, Y, Z , and then the fact, from part (c), that $p_X(x) p_Y(y) = p_{X,Y}(x, y)$, to obtain

$$p_{X,Y,Z}(x, y, z) = p_X(x) p_Y(y) p_Z(z) = p_{X,Y}(x, y) p_Z(z),$$

as desired.

Exercise: A criterion for independence

1/1 point (graded)

Suppose that the conditional PMF of X , given $Y = y$, is the same for every y for which $p_Y(y) > 0$. Is this enough to guarantee independence?

Yes

 Answer: Yes

Solution:

The condition given means that when I tell you the value of Y , the conditional PMF of X will be the same. Thus, the value of Y makes no difference, and, intuitively, we have independence.

For a formal argument, let $c(x) = p_{X|Y}(x | y)$; we can define $c(x)$ this way (without a dependence on y) since we are assuming that $p_{X|Y}(x | y)$ is the same for all y . Now,

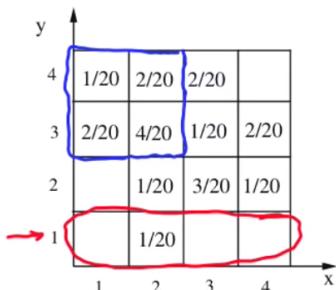

$$p_{X,Y}(x, y) = p_Y(y) p_{X|Y}(x | y) = p_Y(y) c(x).$$

Summing over all y , we obtain

$$p_X(x) = \sum_y p_{X,Y}(x, y) = \sum_y p_Y(y) c(x) = c(x).$$

Therefore, $c(x) = p_X(x)$. It follows that $p_{X,Y}(x, y) = p_{X|Y}(x | y) p_Y(y) = c(x) p_Y(y) = p_X(x) p_Y(y)$, which establishes independence.

Example: independence and conditional independence

• Independent? No

$$P_X(1) = 3/20$$

$$P_{X|Y}(1|1) = 0$$

• What if we condition on $X \leq 2$ and $Y \geq 3$?

Yes .

$1/3$	$1/9$	$2/9$
$2/3$	$2/9$	$4/9$
	$1/3$	$2/3$

Not independent but conditionally independent (blue)

This can be checked by checking that the product of the marginal PMFs (singular) are equal to the join PMF i.e. $2/3 \times 1/3 = 2/9$

Independence and expectations

- In general: $E[g(X, Y)] \neq g(E[X], E[Y])$
- Exceptions: $E[aX + b] = aE[X] + b$ $E[X + Y + Z] = E[X] + E[Y] + E[Z]$

always true

If X, Y are independent: $E[XY] = E[X]E[Y]$

$g(X)$ and $h(Y)$ are also independent: $E[g(X)h(Y)] = E[g(X)] \cdot E[h(Y)]$

$$\begin{aligned} E[g(x, y)] &= g(x, y) = xy \\ &= \sum_x \sum_y xy p_{x,y}(x, y) = \sum_x \sum_y xy p_x(x) p_y(y) \\ &= \underbrace{\sum_x x p_x(x)}_{\text{constant}} \underbrace{\sum_y y p_y(y)}_{\text{constant}} = E[x] E[y] \end{aligned}$$

Exercise: Independence and expectations

2/2 points (graded)

Let X and Y be independent positive discrete random variables. For each of the following statements, determine whether it is true (that is, always true) or false (that is, not guaranteed to be always true).

1. $E[X/Y] = E[X]/E[Y]$

False ▼ ✓ Answer: False

2. $E[X/Y] = E[X] E[1/Y]$

True ▼ ✓ Answer: True

Solution:

- There is no reason why this statement should be true, and it is easy to come up with examples where it fails.
- True. Note that $X/Y = X \cdot (1/Y)$. Furthermore, since X and Y are independent, so are X and $1/Y$. The validity of the statement follows.

Independence and variances

- Always true: $\text{var}(aX) = a^2 \text{var}(X)$ $\text{var}(X + a) = \text{var}(X)$
- In general: $\text{var}(X + Y) \neq \text{var}(X) + \text{var}(Y)$

If X, Y are independent: $\text{var}(X + Y) = \text{var}(X) + \text{var}(Y)$

assume
 $E[X] = E[Y] = 0$
 $E[XY] = E[X]E[Y] = 0$

$$\begin{aligned}\text{var}(X+Y) &= E[(X+Y)^2] = E[X^2 + 2XY + Y^2] \\ &= E[X^2] + 2E[XY] + E[Y^2] = \text{var}(X) + \text{var}(Y)\end{aligned}$$

- Examples:

- If $X = Y$: $\text{var}(X + Y) = \text{var}(2X) = 4\text{var}(X)$
- If $X = -Y$: $\text{var}(X + Y) = \text{var}(0) = 0$
- If X, Y independent: $\text{var}(X - 3Y) = \text{var}(X) + \text{var}(-3Y) = \text{var}(X) + 9\text{var}(Y)$

Variance of the binomial

- X : binomial with parameters n, p
 - number of successes in n independent trials

$X_i = 1$ if i th trial is a success; (indicator variable) *independent*
 $X_i = 0$ otherwise

$$X = X_1 + \dots + X_n$$

$$\begin{aligned}\boxed{\text{var}(X)} &= \text{var}(X_1) + \dots + \text{var}(X_n) \\ &= n \cdot \text{var}(X_1) = \boxed{np(1-p)}\end{aligned}$$

The pair of random variables (X, Y) is equally likely to take any of the four pairs of values $(0, 1), (1, 0), (-1, 0), (0, -1)$. Note that X and Y each have zero mean.

a) Find $\mathbf{E}[XY]$.

$$\mathbf{E}[XY] =$$

0

✓ Answer: 0

b) For this pair of random variables (X, Y) , is it true that $\text{Var}(X + Y) = \text{Var}(X) + \text{Var}(Y)$?

No ✗ Answer: Yes

c) We know that if X and Y are independent, then $\text{Var}(X + Y) = \text{Var}(X) + \text{Var}(Y)$. Is the converse true? That is, does the condition $\text{Var}(X + Y) = \text{Var}(X) + \text{Var}(Y)$ imply independence?

No ✓ Answer: No

Solution:

a) At each possible outcome, we have $XY = 0$, and therefore $\mathbf{E}[XY] = 0$.

b) Since the random variables have zero mean, $\mathbf{E}[X + Y] = 0$, $\text{Var}(X) = \mathbf{E}[X^2]$, and $\text{Var}(Y) = \mathbf{E}[Y^2]$. Combining this with the result from part (a), we conclude that

$$\begin{aligned}\text{Var}(X + Y) &= \mathbf{E}[(X + Y)^2] - (\mathbf{E}[X + Y])^2 \\&= \mathbf{E}[(X + Y)^2] \\&= \mathbf{E}[X^2] + 2\mathbf{E}[XY] + \mathbf{E}[Y^2] \\&= \mathbf{E}[X^2] + \mathbf{E}[Y^2] \\&= \text{Var}(X) + \text{Var}(Y).\end{aligned}$$

c) We have here an example of two random variables that satisfy the condition $\text{Var}(X + Y) = \text{Var}(X) + \text{Var}(Y)$. But these random variables are not independent. For example, the information that $X = 1$ tells us that the value of Y must be zero.

The Hat Problem

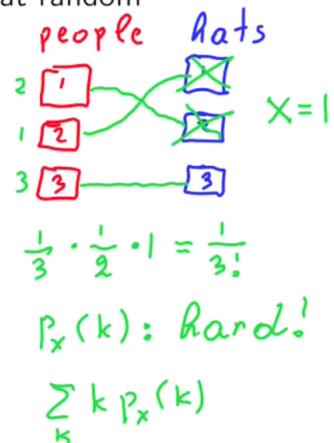

The hat problem

- n people throw their hats in a box and then pick one at random
 - All permutations equally likely $1/n!$
 - Equivalent to picking one hat at a time
- X : number of people who get their own hat
 - Find $E[X] = E[X_1] + \dots + E[X_n] = n \cdot \frac{1}{n} = 1$
 - $$X_i = \begin{cases} 1, & \text{if } i \text{ selects own hat} \\ 0, & \text{otherwise.} \end{cases}$$

$$X = X_1 + X_2 + \dots + X_n$$

$$\bullet E[X_i] = E[X_1] = P(X_1 = 1) = \frac{1}{n}$$

Equivalent to a Bernoulli random variable when $X[i]$ is 1 or 0 (got own hat back or not)

The variance in the hat problem

- X : number of people who get their own hat
 - Find $\text{var}(X)$

$$X_i = \begin{cases} 1, & \text{if } i \text{ selects own hat} \\ 0, & \text{otherwise.} \end{cases}$$

$$\begin{aligned} m &= 2 \\ x_1 = 1 &\Rightarrow x_2 = 1 \\ x_1 = 0 &\Rightarrow x_2 = 0 \end{aligned}$$

$$\bullet \text{var}(X) = E[X^2] - (E[X])^2 = 2 - 1 = 1$$

$$\bullet E[X_i^2] = E[X_1^2] = E[X_1] = 1/n \quad E[X^2] = m \cdot \frac{1}{n} + m(m-1) \cdot \frac{1}{n} \cdot \frac{1}{m-1}$$

$$\bullet \text{For } i \neq j: E[X_i X_j] = E[X_1 X_2] = P(X_1 = 1, X_2 = 1) = P(X_1 = 1 | X_2 = 1)$$

$$= P(X_1 = 1) P(X_2 = 1 | X_1 = 1) = \frac{1}{n} \cdot \frac{1}{n-1}$$

$$X = X_1 + X_2 + \dots + X_n$$

$$X^2 = \underbrace{\sum_i X_i^2}_{\frac{n(n-1)}{n^2-n}} + \underbrace{\sum_{i,j:i \neq j} X_i X_j}_{\bullet}$$

In green the n 's cancel out to give a value of 2 and $(E[X])^2$ is also equal to 1 so $2 - 1 = 1$

Exercise: The hat problem

0/2 points (graded)

Consider the hat problem, with $n = 10$. What is the expected value of $X_3X_6X_7$?

$$\mathbf{E}[X_3X_6X_7] = \boxed{1/3}$$

✖ Answer: 0.00139

Solution:

By symmetry, this is the same as $\mathbf{E}[X_1X_2X_3]$. Since the product $X_1X_2X_3$ is either zero or one, this is the same as

$$\mathbf{P}(X_1X_2X_3 = 1) = \mathbf{P}(X_1 = 1) \cdot \mathbf{P}(X_2 = 1 | X_1 = 1) \cdot \mathbf{P}(X_3 = 1 | X_1 = X_2 = 1).$$

By thinking in terms of the sequential description of the process, we have seen that $\mathbf{P}(X_1 = 1) = 1/10$ and $\mathbf{P}(X_2 = 1 | X_1 = 1) = 1/9$. By a similar argument, given that the first two people obtained their own hats, the third person is faced with 8 hats, one of which is his/her own, and has probability

$$\mathbf{P}(X_3 = 1 | X_1 = X_2 = 1) = 1/8 \text{ of picking it. Thus, the final answer is } (1/10) \cdot (1/9) \cdot (1/8).$$

Solved Problems

1. PMF of a function of a random variable

Bookmark this page

PMF of a function of a random variable. Consider a random variable X such that

$$p_X(x) = \begin{cases} \frac{x^2}{a}, & \text{for } x \in \{-3, -2, -1, 1, 2, 3\}, \\ 0, & \text{otherwise,} \end{cases}$$

where $a > 0$ is a real parameter.

1. Find a .

2. What is the PMF of the random variable $Z = X^2$?

Teaching assistant: Katie Szeto

1.

First use the probability axiom that all probabilities must sum to 1.

$$g(x) = x^2 / a$$

$$g(-3) = 9/a$$

$$\begin{aligned}g(-2) &= 4/a \\g(-1) &= 1/a \\g(1) &= 1/a \\g(2) &= 4/a \\g(3) &= 9/a\end{aligned}$$

$$\begin{aligned}\text{sum} &= 28/a = 1 \\a &= 28\end{aligned}$$

2.

possible values of $Z = \{9, 4, 1\}$ (x^2 for $3/-3, 2/-2, 1/-1$)

$$\begin{aligned}\{Z=1\} &= \{X=-1\} \text{ or } \{X=1\} = 1/a + 1/a = 2/a = 2/28 \\ \{Z=4\} &= \{X=-2\} \text{ or } \{X=2\} = 4/a + 4/a = 8/a = 8/28 \\ \{Z=9\} &= \{X=-3\} \text{ or } \{X=3\} = 9/a + 9/a = 18/a = 18/28\end{aligned}$$

$$\text{sum} = 28/28 = 1$$

2. Sampling people on buses

[Bookmark this page](#)

Sampling people on buses. Four buses carrying 148 job-seeking MIT students arrive at a job convention. The buses carry 40, 33, 25, and 50 students, respectively. One of the students is randomly selected. Let X denote the number of students that were on the bus carrying this randomly selected student. One of the 4 bus drivers is also randomly selected. Let Y denote the number of students on his bus.

1. Which of $E[X]$ or $E[Y]$ do you think is larger? Give your reasoning in words.

2. Compute $E[X]$ and $E[Y]$.

1.

$E[X] > E[Y]$ because chances of choosing a student from a larger bus is greater
Think of two buses with 1 and 1000 students on then X is almost certainly the
bus with 1000 students but the driver Y could be either so $E[Y]$ is roughly 500

2.

Prob.	Val	
$PMF(X) = 40/148$	$x=40$	$E[X] = \text{weighted sum of values by their probabilities}$
$33/148$	$x = 33$	$= 39$
$25/148$	$x = 25$	
$50/148$	$x = 50$	
0	otherwise	

$$PMF(Y) = 1/4 \quad y = 40 \quad E[Y] = 37$$

$$\begin{aligned}
 1/4 & \quad y = 33 \\
 1/4 & \quad y = 25 \\
 1/4 & \quad y = 50 \\
 0 & \text{ otherwise}
 \end{aligned}$$

3. From tail probabilities to expectations

[Bookmark this page](#)

From tail probabilities to expectations.

1. Let X be a random variable that takes nonnegative integer values. Show that

$$\mathbf{E}[X] = \sum_{k=1}^{\infty} \mathbf{P}(X \geq k).$$

Hint: Express the right-hand side of the above formula as a double summation then interchange the order of the summations.

2. Use the formula in the previous part to find the expectation of a random variable Y whose PMF is defined as follows:

$$p_Y(y) = \frac{1}{b-a+1}, \quad y = a, a+1, \dots, b$$

where a and b are nonnegative integers with $b > a$. Note that for $y = a, a+1, \dots, b$, $p_Y(y)$ does not depend explicitly on y since it is a uniform PMF.

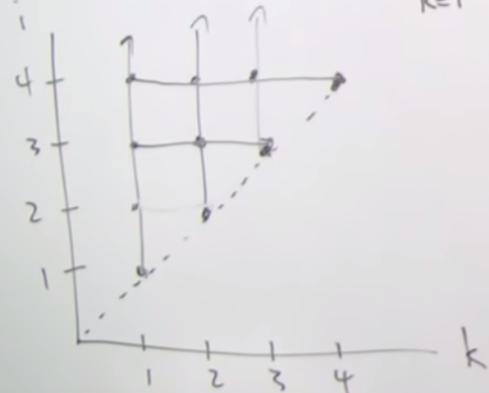

1.

From tail probabilities to expectations

X : nonnegative integer values

$$E[X] = \sum_{k=-\infty}^{\infty} k p_X(k) = \sum_{k=1}^{\infty} k p_X(k) \leftarrow$$

Want to show: $E[X] = \sum_{k=1}^{\infty} P(X \geq k)$

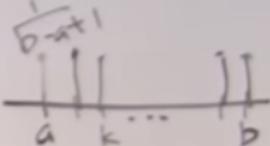

$$\begin{aligned} a) \quad & \sum_{k=1}^{\infty} P(X \geq k) \\ &= \sum_{k=1}^{\infty} \sum_{i=k}^{\infty} P_X(i) \\ &= \sum_{i=1}^{\infty} \left[\sum_{k=1}^i P_X(i) \right] \\ &\Rightarrow \sum_{i=1}^{\infty} i P_X(i) \end{aligned}$$

Final step comes from realising that we're summing the same thing i times so can replace the sum of K from 1 to i with just i

Then the two equations are equal to each other with some differences in letters used

2.

$$b) P_Y(y) = \frac{1}{b-a+1}, y=a, \dots, b$$

$b > a \geq 0$ integers 

$$P(Y \geq k) = \begin{cases} 1 & k \leq a \\ \frac{b-k+1}{b-a+1} & a+1 \leq k \leq b \\ 0 & k \geq b+1 \end{cases}$$

$$\begin{aligned} E[Y] &= \sum_{k=1}^{\infty} P(Y \geq k) \\ &= \sum_{k=1}^a 1 + \sum_{k=a+1}^b \frac{b-k+1}{b-a+1} \\ &= a + \frac{b-a}{2} = \boxed{\frac{b+a}{2}} \end{aligned}$$

4. Coupon collector problem

[Bookmark this page](#)

Coupon collector problem. A particular professor is known for his arbitrary grading policies. Each paper receives a grade from the set $\{A, A-, B+, B, B-, C+\}$, with equal probability, independently of other papers. How many papers do you expect to hand in before you receive each possible grade at least once?

$$K=6$$

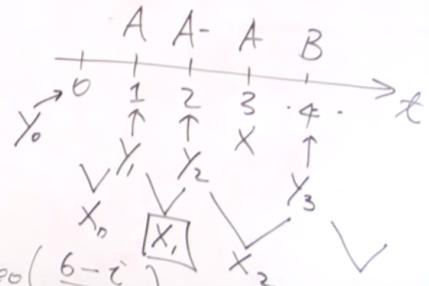

$Y_i = \# \text{ of papers till } i^{\text{th}} \text{ new grade}$

$$\#[Y_6]$$

$$X_i = Y_{i+1} - Y_i$$

$$Y_6 = \sum_{i=0}^5 X_i$$

$$\begin{aligned}\# [X_i] &= \frac{6}{6-i} = 6 \cdot \frac{1}{6-i} \\ \# [Y_6] &= \mathbb{E} \left[\sum_{i=0}^5 X_i \right] = \sum_{i=0}^5 \# [X_i] \\ \# [Y_K] &= K \cdot \sum_{i=1}^{K-1} \frac{1}{i} \approx [K \ln K]\end{aligned}$$

$$X_i = \text{Geo} \left(\frac{6-i}{6} \right)$$

X_i is the number of steps to get a new grade which will change through time geometrically as the probability of getting a grade not already obtained decreases

$K \ln K$ is known as the Scaling Law for the coupon collecting problem (should sum from $i = 1 \dots k$ not $k-1$)

5. Conditioning example

[Bookmark this page](#)

Conditioning example. Suppose that X and Y are independent, identically distributed, geometric random variables with parameter p . Show that

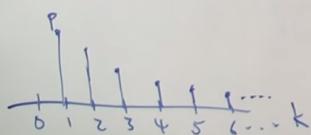

$$\mathbf{P}(X = i \mid X + Y = n) = \frac{1}{n-1}, \quad \text{for } i = 1, 2, \dots, n-1.$$

- Conditional probability
- $$P(A|B) = \frac{P(A \cap B)}{P(B)}$$

- Independence
- Total probability
- Geometric distribution

$$P_X(k) = (1-p)^{k-1} p$$

for $k=1, 2, 3, \dots$

$X+Y$: iid geometric w/ parameter P

$$\text{Show that } P(X=i | X+Y=n) = \frac{1}{n-1} \text{ for } i=1, 2, \dots, n-1$$

$$= \frac{P(\{X=i\} \cap \{X+Y=n\})}{P(X+Y=n)} = \frac{(1-p)^{n-2} p}{(n-1)(1-p)^{n-2} p^2} =$$

$$\rightarrow P(\{X=i\} \cap \{Y=n-i\}) = P(X=i) P(Y=n-i)$$

$$= (1-p)^{i-1} p (1-p)^{n-i-1} p$$

$$\rightarrow \sum_{k=1}^{n-1} P(X=k) P(X+Y=n | X=k) = (1-p)^{n-2} p^2$$

$$= \sum_{k=1}^{n-1} (1-p)^{k-1} p P(Y=n-k) \cancel{(X=k)}$$

$$= \sum_{k=1}^{n-1} (1-p)^{k-1} p (1-p)^{n-k-1} p = \sum_{k=1}^{n-1} (1-p)^{n-2} p^2$$

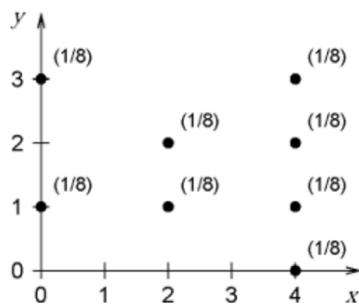

A geometric probability is becoming a uniform one when the conditioning is done

The intuition is that if we get a heads on flip 1 (out of 10) then the remaining flips must all be tails (9) which has a small probability. Then the sum of these is always 10, the heads can appear anywhere in the sequence and have the same probability

6. Joint PMF drill 1

[Bookmark this page](#)

Joint PMF drill #1. Consider a sample space comprised of eight equally likely event points, as shown below:

1. Which value or values of x **maximize** $E[Y | X = x]$?

2. Which value or values of y **maximize** $\text{Var}(X | Y = y)$?

3. Let $R = \min(X, Y)$. Provide a clearly labeled sketch of $p_R(r)$,

4. Let A denote the event $X^2 \geq Y$. Determine numerical values for the quantities $E[XY]$ and $E[XY | A]$.

1. Remember expectation acts like centre of mass

We're looking at the value of Y not the probability

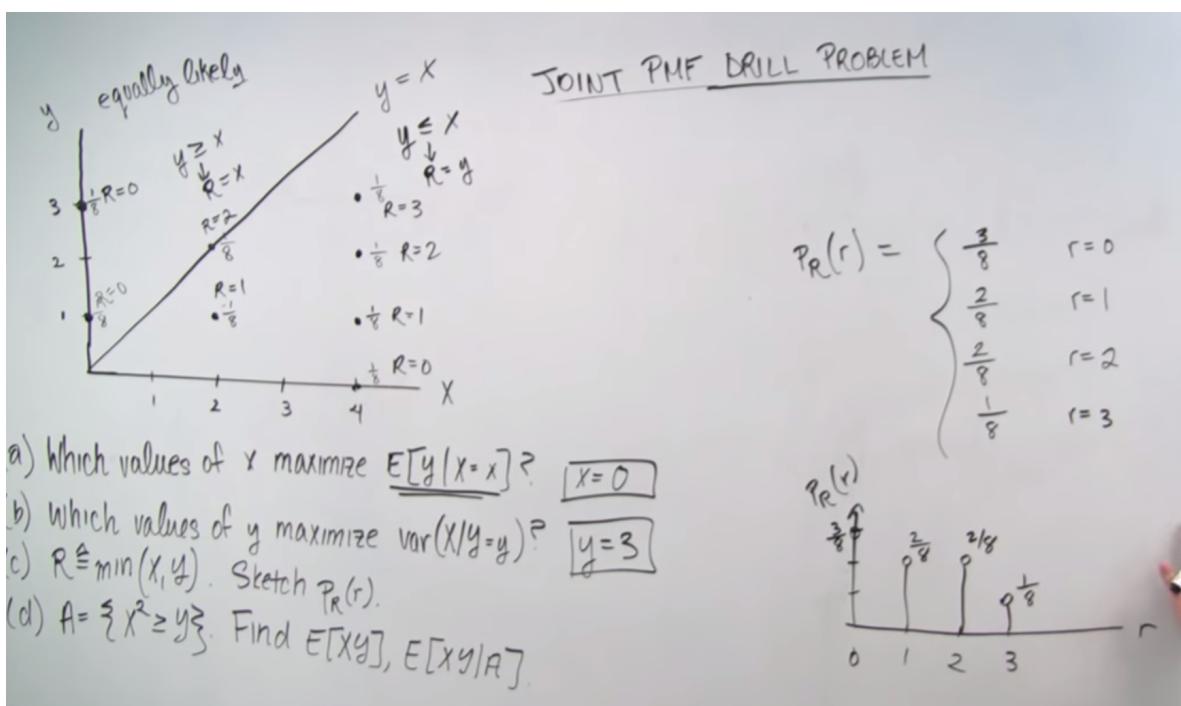

So the answer is $x = 0$ as the average of Y is 2 (3/2 when X is 2 or 4)

2.

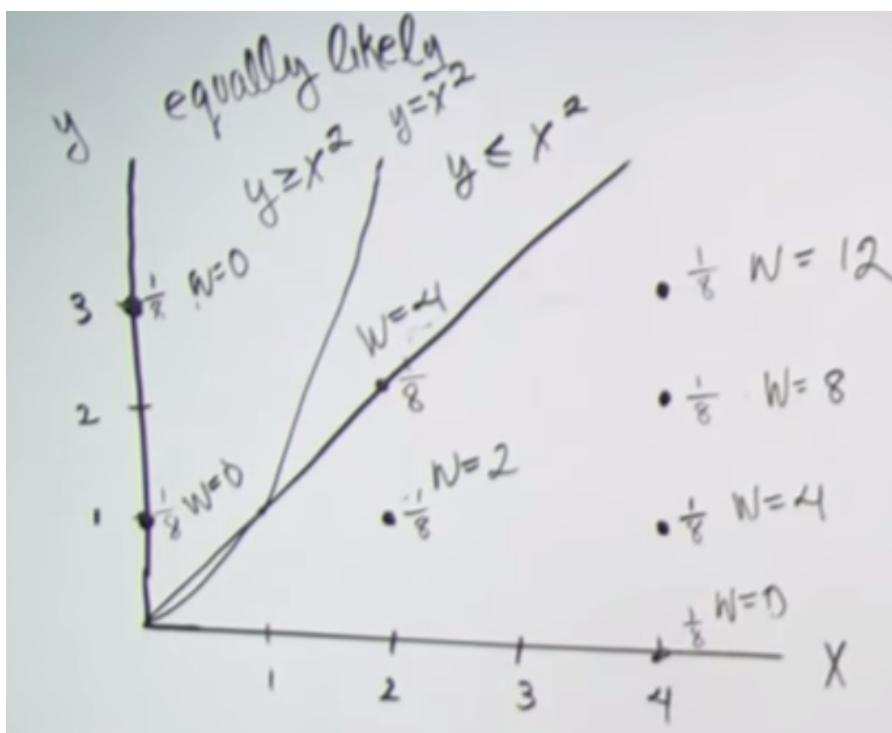

$$\text{var}(X|Y=y) = \begin{cases} 0 & y=0 \\ \frac{8}{3} & y=1 \\ 1 & y=2 \\ 4 & y=3 \end{cases}$$

$$\begin{aligned}\text{var}(X|Y=3) &= E[X^2|Y=3] - E[X|Y=3]^2 \\ &= \frac{0}{2} + \frac{16}{2} - 4 \\ &= 8 - 4 = 4.\end{aligned}$$

3.

4.

$$W \triangleq X^Y$$

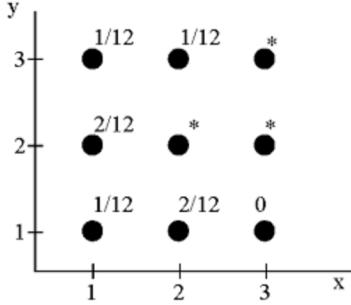

$$E[W] = 0\left(\frac{3}{8}\right) + 2\left(\frac{1}{8}\right) + 4\left(\frac{2}{8}\right) + 8\left(\frac{1}{8}\right) + 12\left(\frac{1}{8}\right)$$

$$= \frac{30}{8} = \boxed{\frac{15}{4}}$$

7. Joint PMF drill 2

[Bookmark this page](#)

Joint PMF drill #2. Random variables X and Y can take any value in the set $\{1, 2, 3\}$. We are given the following information about their joint PMF, where the entries indicated by a * are left unspecified:

- 1) What is $p_X(1)$?
- 2) Provide a clearly labeled sketch of the conditional PMF of Y given that $X = 1$.
- 3) What is $E[Y | X = 1]$?
- 4) Is there a choice for the unspecified entries that would make X and Y independent?

Let B be the event that $X \leq 2$ and $Y \leq 2$. We are told that conditioned on B , the random variables X and Y are independent.

- 5) What is $p_{X,Y}(2, 2)$? (If there is not enough information to determine the answer, say so.)
- 6) What is $p_{X,Y|B}(2, 2)$? (If there is not enough information to determine the answer, say so.)

Problem Sets

Problem 1. Tosses of a biased coin

5/7 points (graded)

Consider 10 independent tosses of a biased coin with the probability of Heads at each toss equal to p , where $0 < p < 1$.

1. Let A be the event that there are 6 Heads in the first 8 tosses. Let B be the event that the 9th toss results in Heads.

Find $\mathbf{P}(B | A)$ and express it in terms of p using standard notation. (You can click on the "STANDARD NOTATION" button below.)

p	✓
<input type="text" value="p"/>	

2. Find the probability that there are 3 Heads in the first 4 tosses and 2 Heads in the last 3 tosses. Express your answer in terms of p using standard notation. Remember not to use ! or combinations in your answer.

$(p^5) \cdot (1-p)^2$	✗
$(p^5) \cdot (1 - p)^2$	

3. Given that there were 4 Heads in the first 7 tosses, find the probability that the 2nd Heads occurred at the 4th toss. Give a numerical answer.

3/35	✗
------	---

4. We are interested in calculating the probability that there are 5 Heads in the first 6 tosses and 3 Heads in the last 5 tosses. Give the exact numerical values of a, b, c, d that would match the answer $ap^7(1 - p)^3 + bp^c(1 - p)^d$.

$a =$	30	✓
$b =$	4	✓
$c =$	8	✓
$d =$	2	✓

Problem 2. Three-sided dice

9/9 points (graded)

We have two fair three-sided dice, indexed by $i = 1, 2$. Each die has sides labelled 1, 2, and 3. We roll the two dice independently, one roll for each die. For $i = 1, 2$, let the random variable X_i represent the result of the i th die, so that X_i is uniformly distributed over the set $\{1, 2, 3\}$. Define $X = X_2 - X_1$.

1. Calculate the numerical values of following probabilities, as well as the expected value and variance of X :

$P(X = 0) =$	3/9	✓
$P(X = 1) =$	2/9	✓
$P(X = -2) =$	1/9	✓
$P(X = 3) =$	0	✓
$E[X] =$	0	✓
$\text{Var}(X) =$	4/3	✓

2. Let $Y = X^2$. Calculate the following probabilities:

$P(Y = 0) =$	3/9	✓
$P(Y = 1) =$	4/9	✓
$P(Y = 2) =$	0	✓

Problem 3. PMF, expectation, and variance

5.4/6 points (graded)

The random variables X and Y have the joint PMF

$$p_{X,Y}(x, y) = \begin{cases} c \cdot (x + y)^2, & \text{if } x \in \{1, 2, 4\} \text{ and } y \in \{1, 3\}, \\ 0, & \text{otherwise.} \end{cases}$$

All answers in this problem should be numerical.

1. Find the value of the constant c .

$$c = \boxed{1/128}$$

2. Find $\mathbf{P}(Y < X)$.

$$\mathbf{P}(Y < X) = \boxed{83/128}$$

3. Find $\mathbf{P}(Y = X)$.

$$\mathbf{P}(Y = X) = \boxed{4/128}$$

4. Find the following probabilities.

(Hint: To avoid double jeopardy with later problem sets, the answers are $\frac{74}{128}$, $\frac{34}{128}$, $\frac{20}{128}$, 0, not necessarily in that order.)

$\mathbf{P}(X = 1) =$	20/128	✓
$\mathbf{P}(X = 2) =$	34/128	✓
$\mathbf{P}(X = 3) =$	0	✓
$\mathbf{P}(X = 4) =$	74/128	✓

5. Find the expectations $\mathbf{E}[X]$ and $\mathbf{E}[XY]$.

$\mathbf{E}[X] =$	3	✓
$\mathbf{E}[XY] =$	7.0938	✓

6. Find the variance of X .

$\mathbf{Var}(X) =$	1.4688	✓
---------------------	--------	---

Problem 4. Joint PMF

5/5 points (graded)

The joint PMF, $p_{X,Y}(x, y)$, of the random variables X and Y is given by the following table:

$y = 1$	$4c$	0	$2c$	$8c$
$y = 0$	$3c$	$2c$	0	$2c$
$y = -1$	$2c$	0	c	$4c$
	$x = -2$	$x = -1$	$x = 0$	$x = 1$

1. Find the value of the constant c .

$$c = \boxed{1/28} \quad \checkmark$$

2. Find $p_X(1)$.

$$p_X(1) = \boxed{14/28} \quad \checkmark$$

3. Consider the random variable $Z = X^2 Y^3$. Find $\mathbf{E}[Z | Y = -1]$.

$$\mathbf{E}[Z | Y = -1] = \boxed{-12/7} \quad \checkmark$$

4. Conditioned on the event that $Y \neq 0$, are X and Y independent?

Yes ✓

5. Find the conditional variance of Y given that $X = 0$.

$$\text{Var}(Y | X = 0) = \boxed{8/9} \quad \checkmark$$

Problem 5. Indicator variables

4/6 points (graded)

Consider a sequence of $n + 1$ independent tosses of a biased coin, at times $k = 0, 1, 2, \dots, n$. On each toss, the probability of Heads is p , and the probability of Tails is $1 - p$.

A reward of one unit is given at time k , for $k \in \{1, 2, \dots, n\}$, if the toss at time k resulted in Tails and the toss at time $k - 1$ resulted in Heads. Otherwise, no reward is given at time k .

Let R be the sum of the rewards collected at times $1, 2, \dots, n$.

We will find $\mathbf{E}[R]$ and $\text{Var}(R)$ by carrying out a sequence of steps. Express your answers below in terms of p and/or n using [standard notation](#) (available through the "STANDARD NOTATION" button below.) Remember to write "*" for all multiplications and to include parentheses where necessary.

We first work towards finding $\mathbf{E}[R]$.

1. Let I_k denote the reward (possibly 0) given at time k , for $k \in \{1, 2, \dots, n\}$. Find $\mathbf{E}[I_k]$.

$$\mathbf{E}[I_k] = \boxed{p^*(1-p)} \quad \checkmark$$

$$p \cdot (1 - p)$$

2. Using the answer to part 1, find $\mathbf{E}[R]$.

$$\mathbf{E}[R] = \boxed{n^*p^*(1-p)} \quad \checkmark$$

$$n \cdot p \cdot (1 - p)$$

The variance calculation is more involved because the random variables I_1, I_2, \dots, I_n are not independent. We begin by computing the following values.

3. If $k \in \{1, 2, \dots, n\}$, then

$$\mathbb{E}[I_k^2] = \boxed{p^*(1-p)} \quad \checkmark$$

$p \cdot (1 - p)$

4. If $k \in \{1, 2, \dots, n - 1\}$, then

$$\mathbb{E}[I_k I_{k+1}] = \boxed{(p^*(1-p))} \quad \times$$

$(p \cdot (1 - p))$

5. If $k \geq 1, \ell \geq 2$, and $k + \ell \leq n$, then

$$\mathbb{E}[I_k I_{k+\ell}] = \boxed{(p^*(1-p))^2} \quad \checkmark$$

$(p \cdot (1 - p))^2$

6. Using the results above, calculate the numerical value of $\text{Var}(R)$, assuming that $p = 3/4, n = 10$.

$$\text{Var}(R) = \boxed{1.5586} \quad \times$$

Well, Q1-5 are given generously in this problem. They all are just hints for Q6.

$$R = I_1 + I_2 + \dots + I_n$$

$$\text{Var}(R) = \mathbb{E}[(I_1 + I_2 + \dots + I_n)^2] - (\mathbb{E}[(I_1 + I_2 + \dots + I_n)])^2$$

$$\mathbb{E}[(I_1 + I_2 + \dots + I_n)^2] = n \times \mathbb{E}[I_k^2] + n \times (n - 1) \times \mathbb{E}[I_k I_l]$$

, given $k \neq l$. I can only help upto this point.

Edit: The suggestion above is more like the guideline how to link $\mathbb{E}[I_k^2]$ and $\mathbb{E}[I_k I_l]$ to $\text{Var}(R)$. The last equation, however, is not right in this problem (Q4 and Q5 justify that) and create some confusion. I thus would edit the last equation as follows:

$$\begin{aligned} \mathbb{E}[(I_1 + I_2 + \dots + I_n)^2] &= \sum_1^n \mathbb{E}[I_k^2] + \sum_{k \neq l} \mathbb{E}[I_k I_l] \\ &= n \times \mathbb{E}[I_k^2] + \sum_{k \neq l} \mathbb{E}[I_k I_l] \end{aligned}$$

Problem 6

For each of the following statements, state whether it is true (meaning, always true) or false (meaning, not always true):

1. Let X and Y be two binomial random variables.

(a) If X and Y are independent, then $X + Y$ is also a binomial random variable.

True	✗
------	---

(b) If X and Y have the same parameters, n and p , then $X + Y$ is a binomial random variable.

False	✓
-------	---

(c) If X and Y have the same parameter p , and are independent, then $X + Y$ is a binomial random variable.

True	✓
------	---

2. Suppose that, $\mathbf{E}[X] = 0$. Then, $X = 0$.

False	✓
-------	---

3. Suppose that, $\mathbf{E}[X^2] = 0$. Then, $\mathbf{P}(X = 0) = 1$.

False	✗
-------	---

4. Let X be a random variable. Then, $\mathbf{E}[X^2] \geq \mathbf{E}[X]$.

False	✓
-------	---

5. Suppose that, X is a random variable, taking positive integer values, which satisfies $\mathbf{E}[(X - 6)^2] = 0$. Then, $p_X(4) = p_X(5)$.

True	✓
------	---

6. Suppose that $\mathbf{E}[X] \geq 0$. Then, $X \geq 0$ with probability 1, i.e., $\mathbf{P}(X \geq 0) = 1$.

False	✓
-------	---

Summary

UNIT 4: Discrete random variables — Summary

- r.v.'s and PMFs: $p_X(x)$, $p_{X,Y}(x,y)$, $p_{X|Y}(x|y)$, $p_{X|A}(x)$
- Expectation: $\mathbf{E}[X]$, $\mathbf{E}[X|A]$, $\mathbf{E}[X|Y=y]$
Expected value rule: $\mathbf{E}[g(X,Y)]$, $\mathbf{E}[g(X,Y)|A]$, $\mathbf{E}[g(X,Y)|Z=z]$
Linearity: $\mathbf{E}[aX + bY] = a\mathbf{E}[X] + b\mathbf{E}[Y]$
- Variance: $\text{var}(X)$, $\text{var}(X|A)$, $\text{var}(X|Y=y)$ $\text{var}(X) = \mathbf{E}[X^2] - (\mathbf{E}[X])^2$
- Independence of r.v.'s: $p_{X,Y} = p_X \cdot p_Y$
$$\mathbf{E}[XY] = \mathbf{E}[X] \cdot \mathbf{E}[Y] \quad \text{var}(X+Y) = \text{var}(X) + \text{var}(Y)$$
- Multiplication rule $p_{X,Y,Z}(x,y,z) = p_Z(z) p_{Y|Z}(y|z) p_{X|Y,Z}(x|y,z)$
- Total probability theorem $p_X(x) = \sum_y p_Y(y) p_{X|Y}(x|y)$
- Total expectation theorem $\mathbf{E}[X] = \sum_y p_Y(y) \mathbf{E}[X|Y=y]$
- Examples: Bernoulli, indicators, uniform, binomial, geometric

Erratum: The Linearity property should read $\mathbf{E}[aX + bY] = a\mathbf{E}[X] + b\mathbf{E}[Y]$ instead of $\mathbf{E}[aX + bY] = a\mathbf{E}[Y] + b\mathbf{E}[Y]$.
